

For my final project, I'm making a website all about my cat, Lucy. The whole idea is to show my love for her and cute moments of her through photos, little animations, and interactive moments that make the viewer feel like they're hanging out with her too.

I want to make the page clean and easy to go through. So that means having grided galleries, organized sections and interactivities features that are clear and easy to read. I'm using Lobster for the titles because it feels classy but also playful because of the rounded strokes/edges it has. And Montserrat for the main text because it's easy to read. The colors are mostly black, white, and light green accents, which represents Lucy. I do remember the suggestion about having more green colors to make the page more colorful. Right now, all the pages share similar layouts and spacing, I'm still thinking if I should alter the layouts a little bit, so it doesn't feel repetitive.

Ideas I want to add:

- Sound effect when you virtually send love to Lucy and heart shape appearing on the screen every time you click the button
- When you pat Lucy, there's a sound of her purring and maybe the image turns into a different one.
- Pictures stacked on top of each other, and you must manually move it to the side to see the next one
- Change the mouse to a cat teaser
- Have a little logo that is shaking left and right for infinite time
- Maybe for Lucy in action section, when you hover over the pictures, the pictures change and makes a sound.
- Maybe a set of things that user can pick for Lucy: like treats, toys, beds, clothing's.
- Open to more ideas!
