

For my final project, I'm making a website all about my cat, Lucy. The whole idea is to show my love for her and cute moments of her through photos, little animations, and interactive moments that make the viewer feel like they're hanging out with her too.

I want to make the page clean and easy to go through. So that means having grided galleries, organized sections and interactivities features that are clear and easy to read. I'm using Lobster for the titles because it feels classy but also playful because of the rounded strokes/edges it has. And Montserrat for the main text because it's easy to read. The colors are mostly black, white, and light green accents, which represents Lucy. I do remember the suggestion about having more green colors to make the page more colorful. I would have to play around with the colors to see where it would be more aesthetic looking. Right now, all the pages share similar layouts and spacing, I think differ the layout a little so it doesn't feel repetitive and maybe just change the other page into something else instead of having it as another gallery

SOME IDEAS I HAVE: When users click the button to "send love" to Lucy, a sound effect will play, and animated heart shapes will appear on the screen. When users pat Lucy, another sound, like purring, will activate, and her image will change to reflect her reaction. As well as a custom mouse cursor shaped like a cat teaser and a small logo on the top of the screen with the headers will continuously shake from side to side to add a lively touch. In the "Lucy in Action" section, hovering over each picture will trigger an image change along with a sound effect. Finally, I plan to create a set of items for users to choose from like treats, toys, beds, and clothing to make the interaction more dynamic and fun.
